## FenderTeam Cell-Fender Systems and Bollards for the Barbours Cut Terminal at the Port of Houston, TX - USA

In Fall of 2013, FenderTeam was awarded with the contract for the manufacturing and supply of 64nos. Cell-Fender Systems and 32nos. Double-Bitt Bollards for the Rehabilitation of Wharf 1 at Barbours Cut Terminal at the Port of Houston.

The rubber units for this project went through extensive testing at FenderTeam's production facilities overseas under the supervision of a well recognized, independent third party. Only after all fenders passed the stringent PIANC test requirements, they were then sent to the site for installation.

Testing at the manufacturers facilities under the supervision of an independent third party and the final client is the most efficient and reliable test procedure and has been the standard for decades in the fender industry.

Wharf 1 will become operational later this year and all stakeholders are excited to experience the exceptional performance of our high quality fender products under the demanding conditions at this terminal. The project will rank as one of the most interesting projects within our 2,500+ references .
